Abstract

Method and system for diverting telecommunications
connections

In the case of a method for diverting
telecommunications connections, a prescribed number of
line identifications (Al_1 – Al_N) are first made
available. Upon request to participate in the diverting
method, a line identification (Al_1 – Al_N) that is still
free is allocated, all telecommunications connections
directed to this line identification (Al_1) subsequently
being diverted to a telecommunications terminal (A2).
